

Who are the Ideal Candidates for Radiation Treatment?

- » Patients who are not surgical candidates for medical reasons (e.g. blood thinning medication, allergic to local anesthesia)
- » Patients who are not interested in having surgery
- » Patients who require additional radiation treatment for aggressive skin cancers following surgical treatment
- » Patients with challenging anatomical locations e.g. eyes, nose, ears, scalp
- » Patients with positive margins after surgical excision to reduce the risk of recurrence
- » Patients with busy schedules

Important Patient Information:

This brochure is not intended to provide any medical advice. Only your doctor can advise you as to which treatment options are appropriate, depends on the type and stage of your condition. Your doctor must exercise his or her individual medical judgment in making treatment decisions as each patient has a unique clinical presentation and treatment needs.

This Xoft Surface Applicator is indicated for use with the Xoft Electronic Brachytherapy System to deliver surface brachytherapy. Your doctor will advise you as to which treatment options are appropriate, depending on the type and stage of your condition.

Be sure to speak with your physician regarding the warnings, precautions, and potential complications/adverse events associated with the use of this device. Common side effects include redness, dryness, itching, soreness, and blistering. There are other important warnings, precautions, and potential complications/adverse events. You should discuss these with your doctor.

Surgery is not the only option. Electronic Brachytherapy (eBx) is a safe and effective non-surgical treatment for your non-melanoma skin cancer.

Electronic Brachytherapy (eBx) for Skin Cancer

Patients with non-melanoma skin cancer (NMSC) now have the option of receiving radiation therapy utilizing the Xoft® Electronic Brachytherapy (eBx®) System. Unlike alternative brachytherapy procedures, the Xoft System utilizes an isotope-free miniature

X-ray source. The X-ray source delivers high dose radiation directly to the target area. The treatment is non-invasive and painless. Surgical excision (Mohs) is the most common skin cancer treatment, but in certain patients,

eBx can be an ideal alternative, with excellent (>90%) to good cosmetic results⁴.

Xoft eBx for skin cancer provides a variety of benefits including:

- » Targeted treatment resulting in good to excellent cosmetic results
- » Painless, non-invasive treatment
- » No radioactive isotopes
- » Fewer visits compared with traditional external beam therapy
- » Low energy allows medical personnel to remain in the treatment room with the patient

What Should I Expect?

Xoft eBx is administered under the direction of a radiation oncologist. The simple outpatient treatment regimen and prescription depend on tumor size, type, depth, patient age, prior treatments and other criteria. An individualized treatment plan with custom shielding is developed for each patient. During Xoft radiation therapy:

- » Small surface applicator is placed on the skin where the radiation is to be delivered
- » Flexible shield can be utilized to protect the adjacent non-target tissues
- » Miniature X-ray source is then placed in the applicator to deliver radiation
- » Radiation is delivered while the medical personnel remain in the treatment room with the patient
- » X-ray source is turned off at the completion of the treatment
- » All devices are removed and the patient is able to return to normal daily activities
