

Cervical Applicator

Benefits

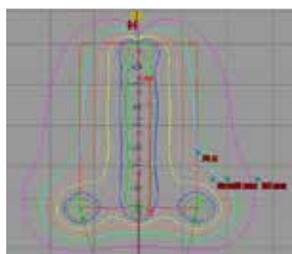

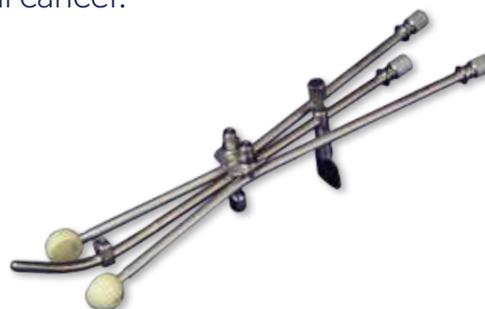

- Key component of complete Xoft System, an integrated, radiation therapy platform solution
- Precise delivery of targeted treatment, minimizing dose to surrounding healthy tissue
- Fast dose fall-off enables treatment in a standard room with minimal shielding requirements
- Accelerated treatment time increases operational efficiency and patient satisfaction
- Patient transport to treatment vault not required after imaging
- CT compatibility and MR conditional ¹

With a range of expertly designed applicators for both endometrial and cervical cancer, simplified, targeted radiation therapy for gynecological cancer treatment in a minimally shielded setting is possible with GYN electronic brachytherapy (eBx[®]).

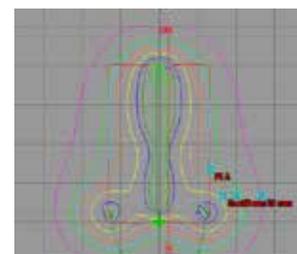

The Axxent cervical applicator is a key component of the Xoft[®] Axxent[®] Electronic Brachytherapy (eBx[®]) System[®], empowering targeted intracavitary treatment of cancer of the uterus, cervix, endometrium and vagina.

The cervical applicator set provides three channels for the miniaturized, x-ray source to deliver isotope-free, high dose rate, low energy radiation treatment. Expertly designed to maintain dose coverage to Point A, the applicator walls contain titanium to filter out low energy radiation from the source. Dose volume histograms confirm that the 50 kV source has comparable PTV coverage to Ir-192, with lower dose to critical structures.

Combined with the comprehensive capabilities of the Xoft System, the Axxent cervical applicator offers an attractive option to physicians and patients for improved flexibility, precision and personalization in the targeted treatment of gynecological cancer.
